Sprint 04

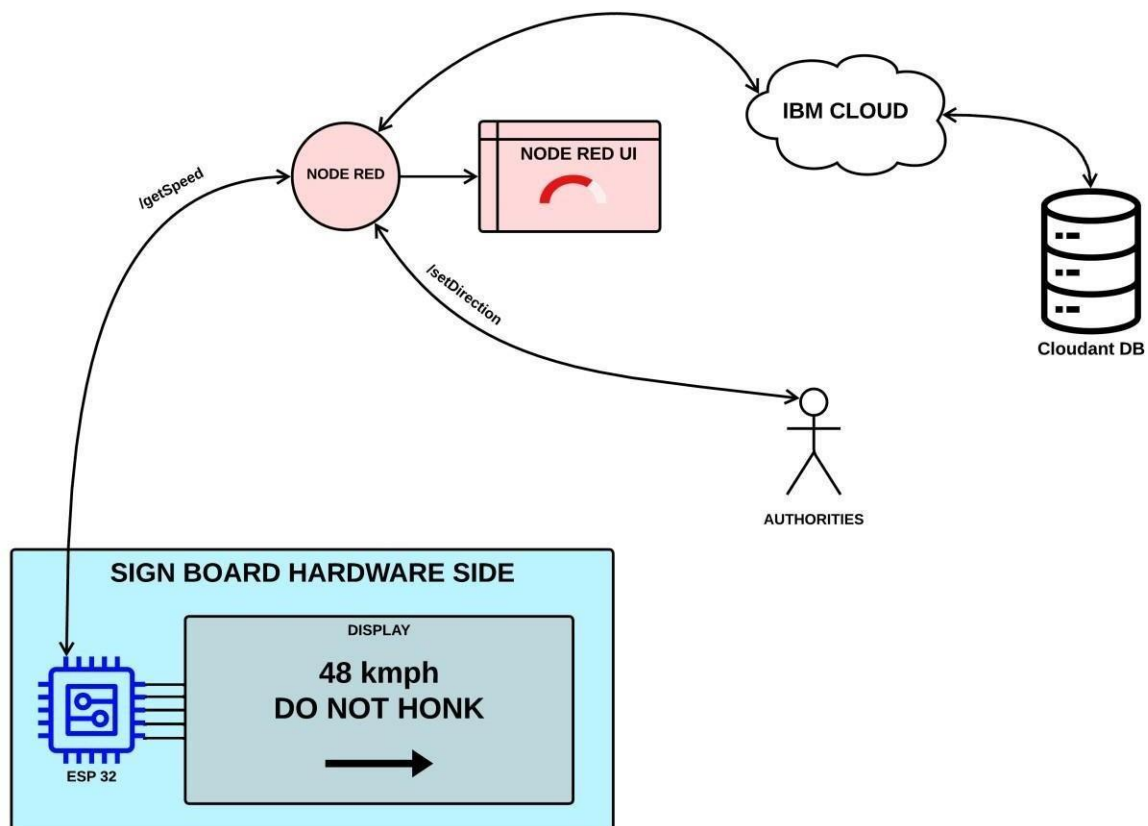

Signs with Smart Connectivity for Better Road Safety

Team ID - PNT2022TMID46295

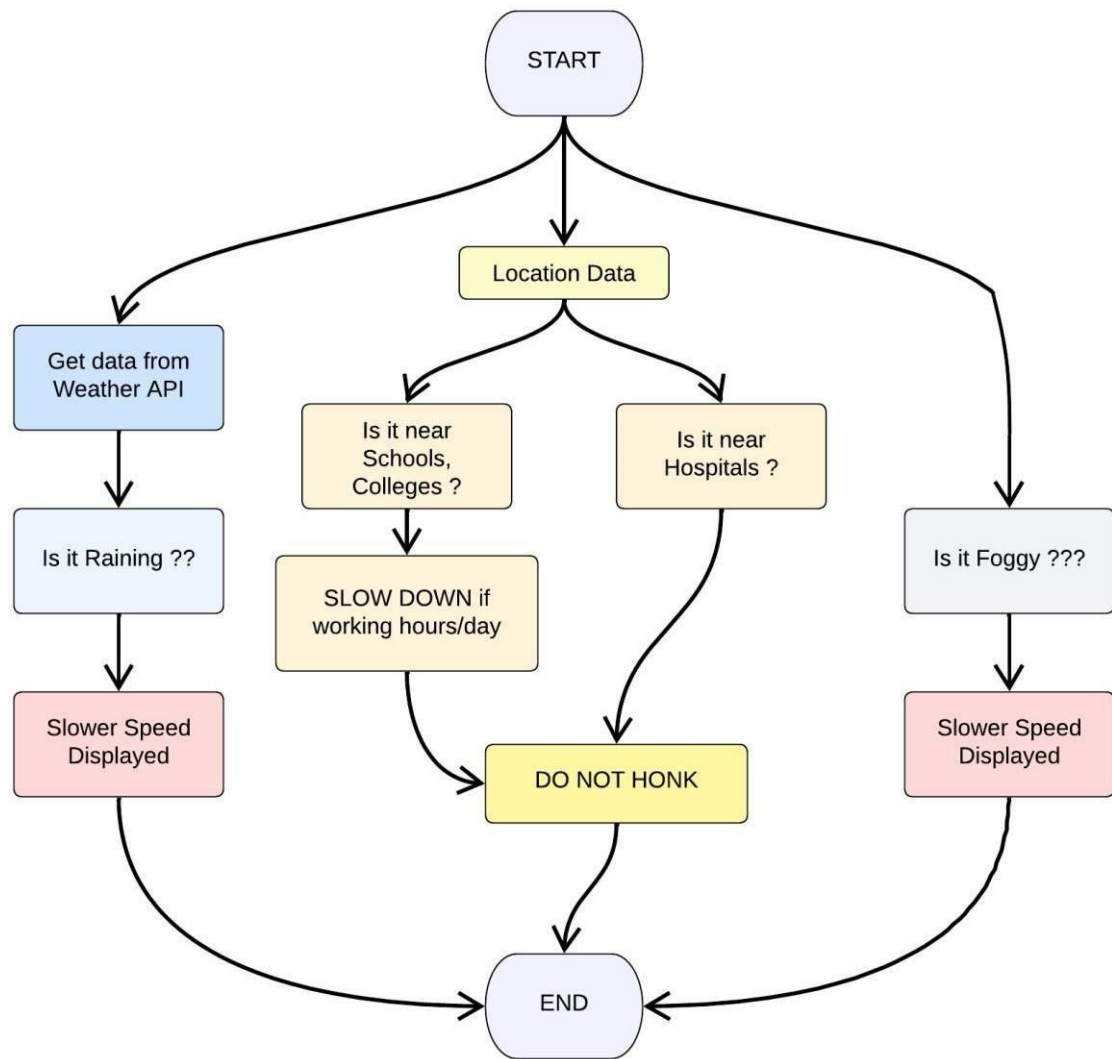

Sprint Goals :

1. Hardware & Cloud integration **Process**

Flow :

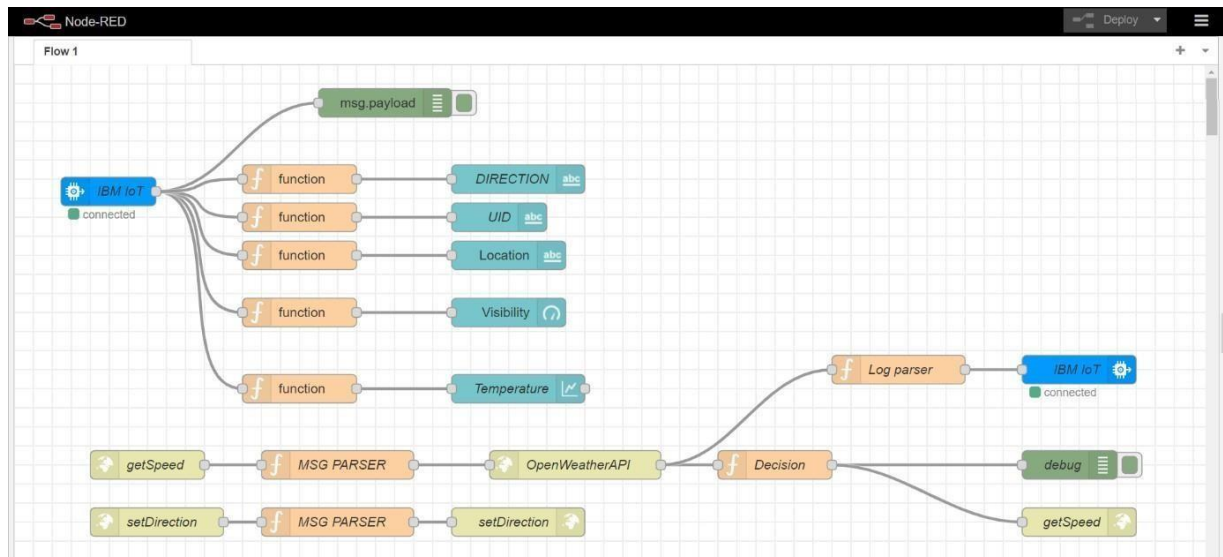

Code Flow :

Node RED :

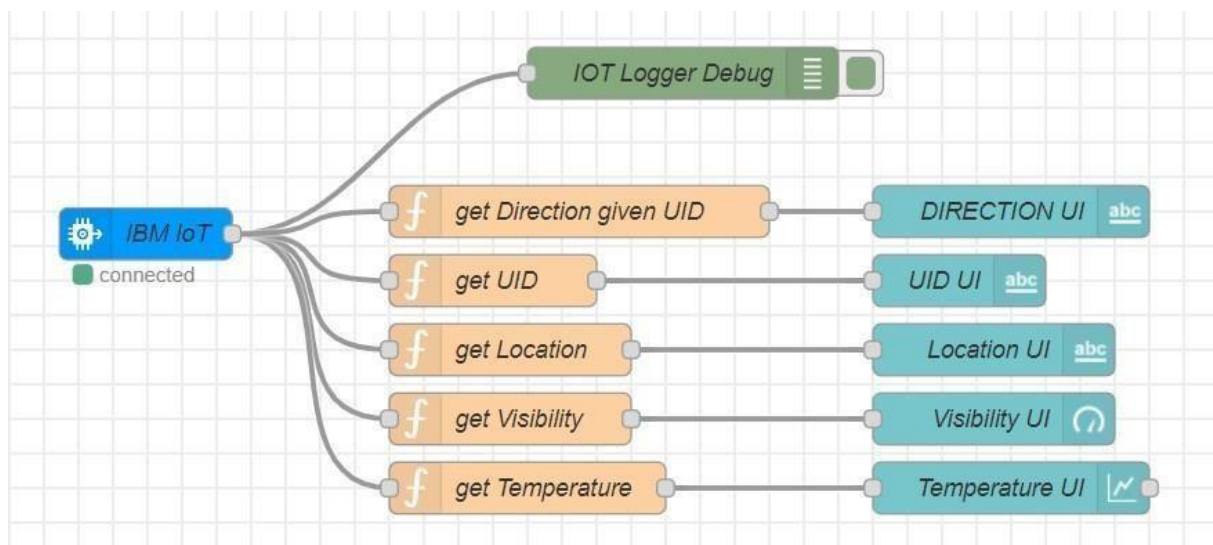

Node RED flow :

There are 3 flows in the above Node RED flow. They are

1. Node RED UI flow
2. /getSpeed API flow
3. /setDirection API flow

Node RED UI flow :

1. **"IBM IOT"** node connects the backend to Node RED UI
2. The function nodes such as **"get Direction given UID"**, **"get UID"**, **"get Location"**, **"get Visibility"** & **"get Temperature"** extract the respective data out and provides them to the UI nodes **"Direction UI"**, **"UID UI"**, **"Location UI"**, **"Visibility UI"** & **"Temperature UI"**.

```
// get Direction given UID
msg.payload = global.get(String(msg.payload.uid)); return
msg;

// get UID
```

```

msg.payload = msg.payload.uid; return
msg;

// get Location
msg.payload = msg.payload.location; return
msg;

// get Visibility
msg.payload = msg.payload.visibility; return
msg;

// get Temperature
msg.payload = msg.payload.temperature; return
msg;

```

3. **"IOT Logger Debug"** node logs the data at debugger.

2. /getSpeed API flow :

1. **"getSpeed In"** node is an http end point. It accepts parameters like microcontroller UID, location, school & hospital zones info.
2. **"Message Parser"** node parses the data and passes on only required information to the next node

```
global.set("data",msg.payload);
```

```

msg.payload.q = msg.payload.location;
msg.payload.appid = "bf4a8d480ee05c00952bf65b78ae826b"; return
msg;

```

3. **"OpenWeatherAPI"** node is a http request node which calls the OpenWeather API and send the data to the next node.
4. **"Log Parser"** node extracts specific parameters from the weather data and and sends it to the next node.

```

weatherObj = JSON.parse(JSON.stringify(msg.payload)); localityObj
= global.get("data");

```

```
var suggestedSpeedPercentage = 100;
```

```
var preciseObject = {
```

```

    temperature : weatherObj.main.temp - 273.15,
location : localityObj.location,    visibility
: weatherObj.visibility/100,    uid :
localityObj.uid,
    direction : global.get("direction")
};
msg.payload = preciseObject;
return
msg;

```

5. **"IBM IoT"** node here (IBM IoT OUT) connects the **"IBM IoT"** node (IBM IoT IN) mentioned in the **Node RED UI flow** which enables UI updation and logging.
6. **"Decision Maker"** node processes the weather data and other information from the micro controller to form the string that is to be displayed at the Sign Board

```

weatherObj = JSON.parse(JSON.stringify(msg.payload)); localityObj
= global.get("data");

var suggestedSpeedPercentage = 100;

var preciseObject = {
    temperature : weatherObj.main.temp - 273.15,
    weather : weatherObj.weather.map(x=>x.id).filter(code => code<700),
visibility : weatherObj.visibility/100
};
if(preciseObject.visibility<=40)
suggestedSpeedPercentage -=30

switch(String(preciseObject.weather)[-1]) //
https://openweathermap.org/weatherconditions refer weather codes meaning here
{
    case "0" : suggestedSpeedPercentage -=10;break;
case "1" : suggestedSpeedPercentage -=20;break;    case
"2" : suggestedSpeedPercentage -=30;break;
}
msg.payload = preciseObject;

var doNotHonk = 0;
if(localityObj.hospitalZone=="1"||localityObj.schoolZone=="1")
doNotHonk = 1;

var returnObject = {
    suggestedSpeed : localityObj.usualSpeedLimit*(suggestedSpeedPercentage/100),
doNotHonk : doNotHonk
}

msg.payload = String(returnObject.suggestedSpeed) + " kmph \n\n" +
(returnObject.doNotHonk==1?"Do Not Honk:") + "$" +
global.get(String(localityObj.uid));
return
msg;

```

7. **"getSpeed Out"** node returns a http response for the request at node **"getSpeed In"**.
8. **"speed Out Logger Debug"** logs the data for debugging.

3. /setDirection API flow :

1. **"setDirection In"** node is an http end point. It accepts parameters like microcontroller UID & direction.
2. **"set Direction Function"** node sets the direction for the given UID.

```
global.set(String(msg.payload.uid),msg.payload.dir); return msg;
```

3. **"setDirection Out"** node returns a http response for the request at node **"setDirection In"**.
